Anorexia Nervosa Research Study

Johns Hopkins researchers are conducting a placebo-controlled trial to examine the effectiveness of a research medication in the treatment of adults with anorexia nervosa. Participants will be offered 16 weeks of medication (active or inactive) and weekly outpatient medical monitoring by a psychiatrist. The treatment will be provided at no cost.

To participate, you must

- have anorexia nervosa
- be 18-55 years old
- be medically stable for outpatient treatment
- complete assessments (interviews, questionnaires and medical evaluations) at intervals throughout the 16-week study and at 1- and 2-month follow-ups.
- information gathered will remain confidential.
