

# Phalloplasty Hair Removal Radial Forearm and Lateral Thigh

Hair should be removed from the regions labelled “1” (urethra), and “2” (penile shaft).

Start with hair removal from region “1” (shaded area) before starting on region “2” (unshaded).

The focus should be on complete hair removal from the “1” region, as this area will be used for the new urethra and hair cannot be removed after surgery. Incomplete hair removal can lead to urethral blockages and possible infections.

Hair should be removed from the regions labelled “1” (urethra), and “2” (penile shaft).

Start with hair removal from region “1” (shaded area) before starting on region “2” (unshaded). This area is used for the urethra and will not be accessible for hair removal after surgery.

Incomplete hair removal can lead to urethral blockages and possible infections.
