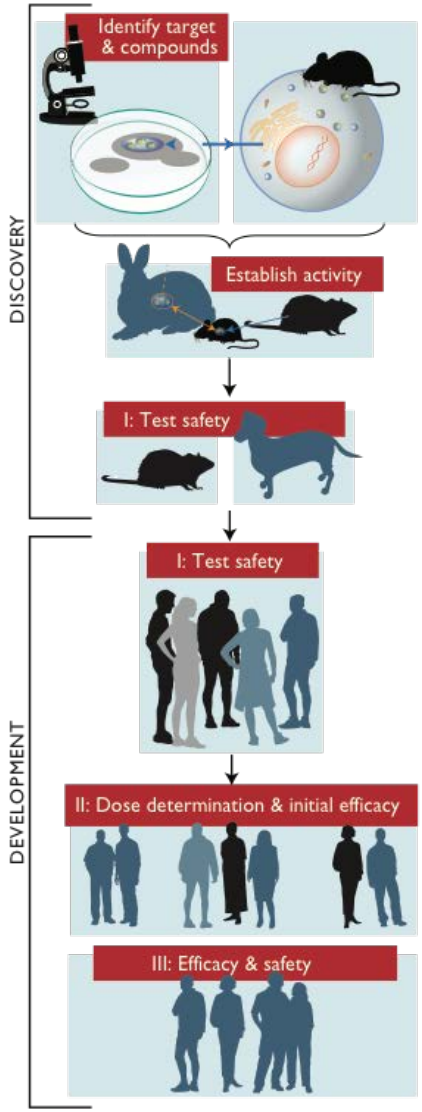
Capsaicin (IA)		Yes	Yes	Stevens, Arthritis Rheumatol, 2019; Lascelles, IASP, 2020

The practicalities of running POC studies in companion animals

- Sites and expertise available, allowing veterinary oversight
- Veterinary CRO assistance available
  - GCP; Protocol; Agreements;
- Recruitment (owners; appropriate phenotype)
- Do need sufficient toxicity data in order to test in pet animals
- Ethical Regulations; IACUC; owner consent
- Expense

TRiP



Discovery:
face validity &
relevance of the target

Discovery

- Companion animals can be pain phenotyped
- Veterinarians have unprecedented access to biological samples
- Interrogate target tissues for target of interest, or *in an unbiased way*

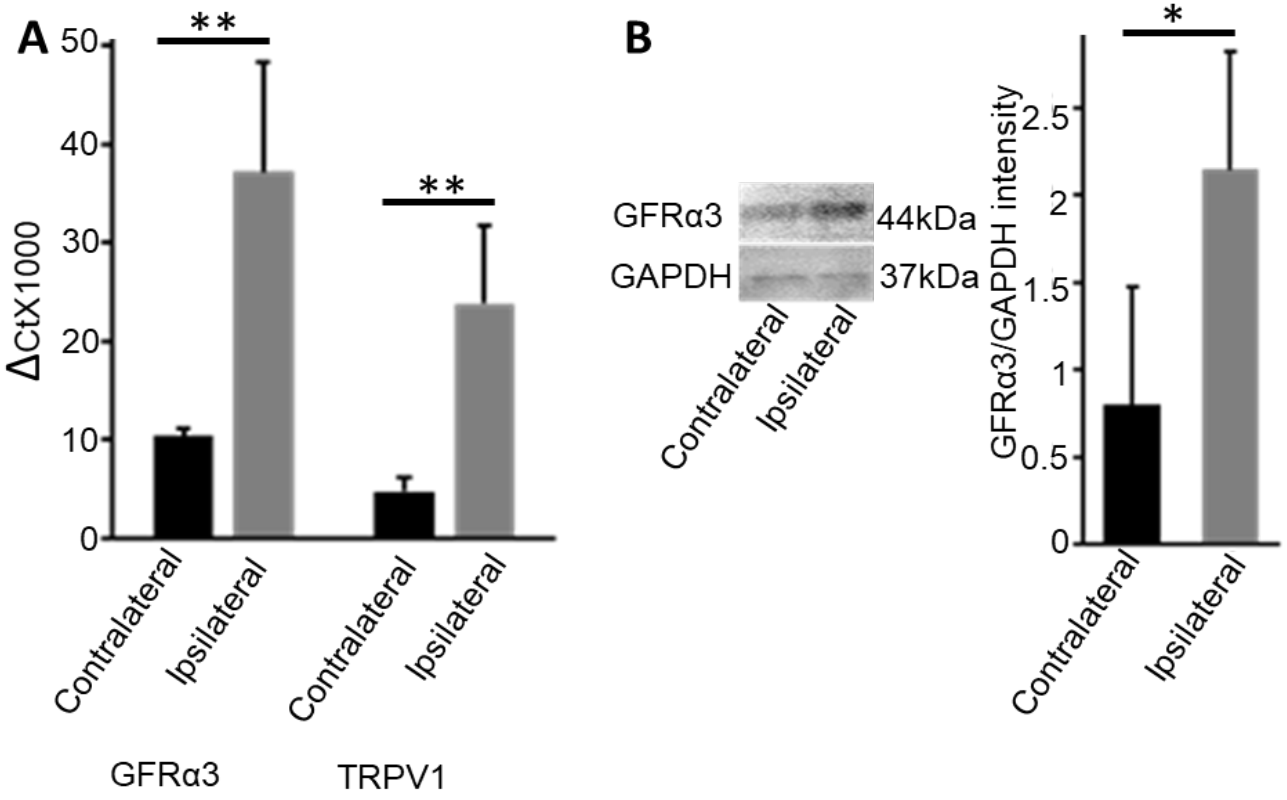
Available online at www.jpain.org and www.sciencedirect.com

Molecular Signatures of Mouse TRPV1-Lineage Neurons Revealed by RNA-Seq Transcriptome Analysis

RT-PCR for a variety of receptors expressed on TRPV1

TRiP

GFRα3 is upregulated in dogs with naturally occurring OA pain; DRG serving OA-pain joints versus DRG serving normal joints



European Journal of Neuroscience, Vol. 13, pp. 2177–2182, 2001

SHORT COMMUNICATION
GFRalpha3 is expressed predominantly in nociceptive sensory neurons

Olivia E. Orozco, Lee Walus, Dinah W. Y. Sah, R. Blake Pepinsky and Michele Sanicola
Biogen, 14 Cambridge Center, Cambridge MA 02142, 617 679-3307, USA

- Most DRG neurons that are GFRα3 positive are:
  - TRPV1 +ve
  - TrkA +ve
  - RET +ve
  - Peripherin +ve

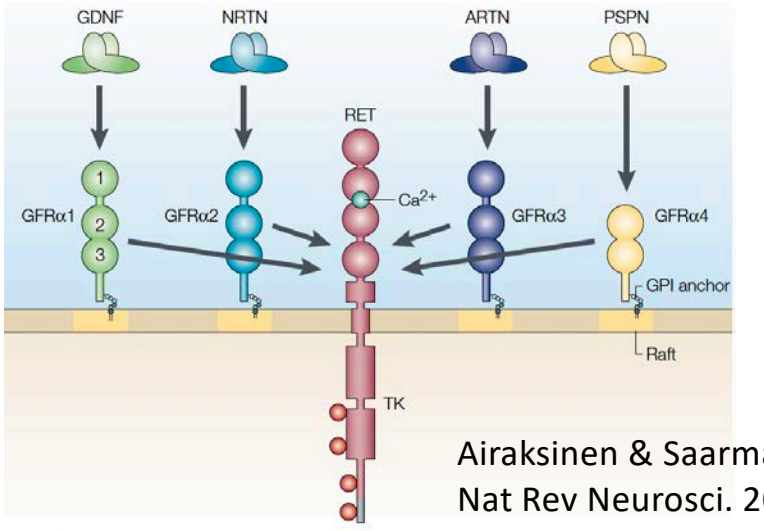
TRiP

GFRα3 is a GFL growth factor family receptor that complexes with the RET tyrosine kinase to activate intracellular signaling.

GDNF Family of Ligands (GFL) receptors:

1.GDNF ⟷ GFRα1
2.NRTN ⟷ GFRα2
3.ARTN ⟷ **GFRα3**
4.PSPN ⟷ GFRα4

RET ^{P} ⟹ Intracellular signaling



Airaksinen & Saarma
Nat Rev Neurosci. 2002

GDNF family ligands (GFLs):

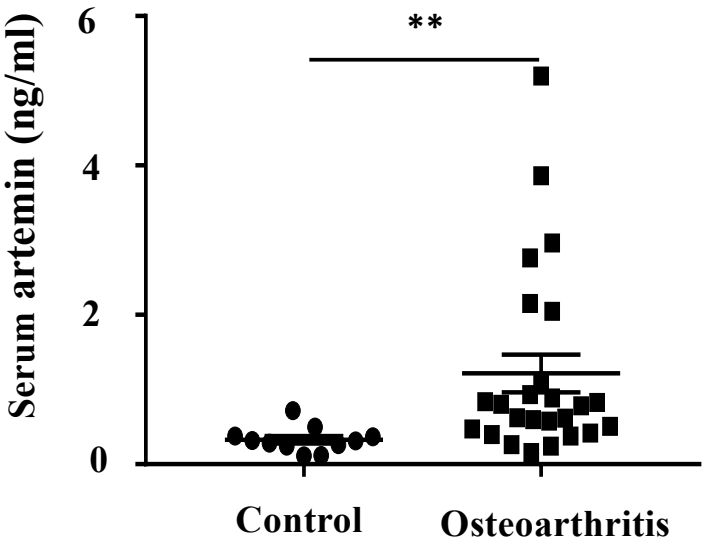
1.Glial cell line-derived neurotrophic factor (GDNF)
2.Neurturin (NRTN)
3.Artemin (ARTN)
4.Persephin (PSPN)

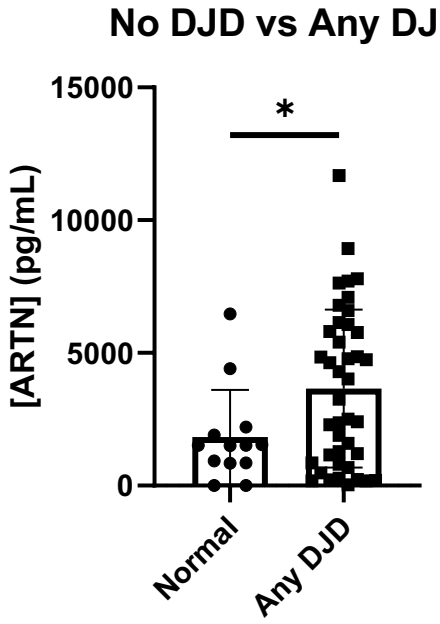
Intra-cellular signaling

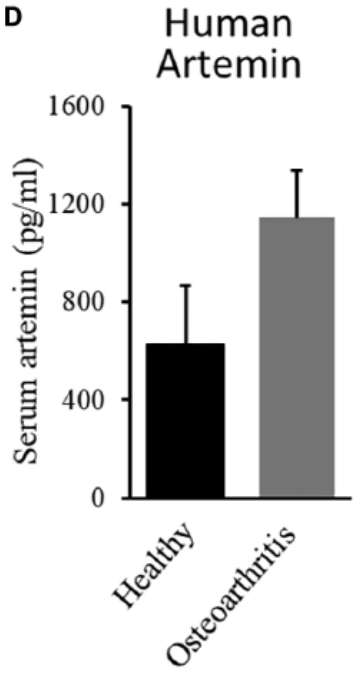
TRPV1
TRPA1
TRPM8
ASIC 1
ASIC 3
TRPV3

TRiP

Serum ARTN is elevated in dogs and cats (& humans) with OA-pain compared to healthy controls





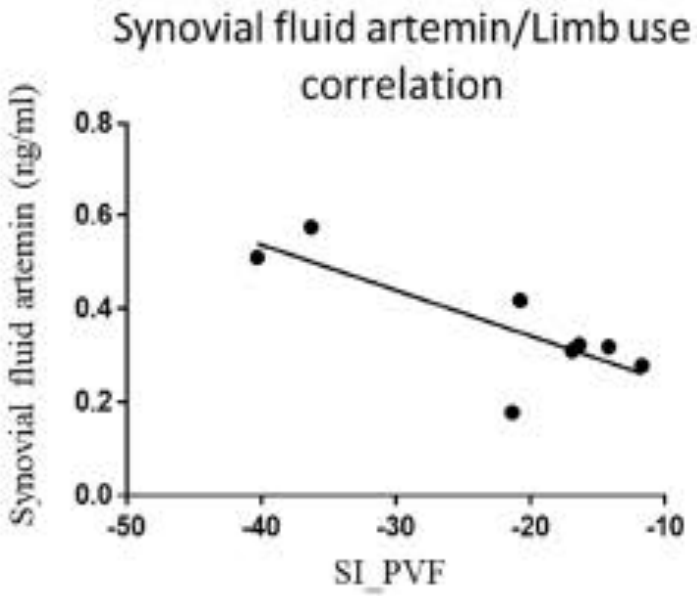


- OA dogs and normal dogs (n=26 OA ; n=11 normal; p=0.007)

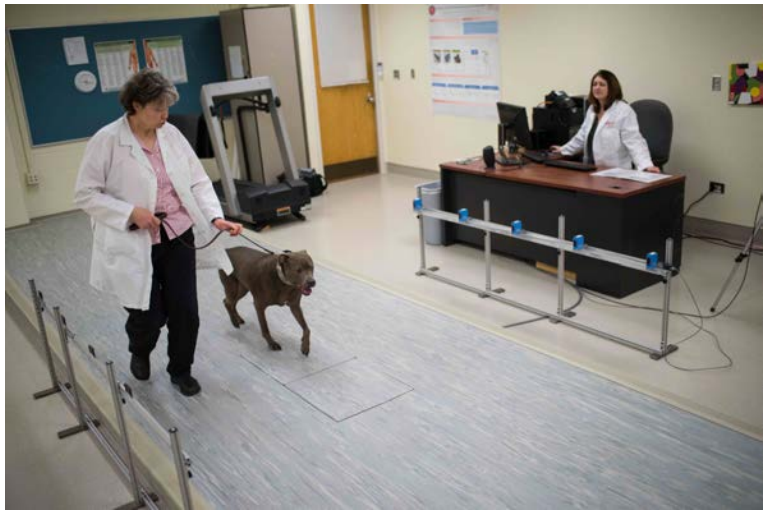
DJD-pain cats and control cats (n=41 DJD-pain ; n=13 control; p=0.011)

TRiP

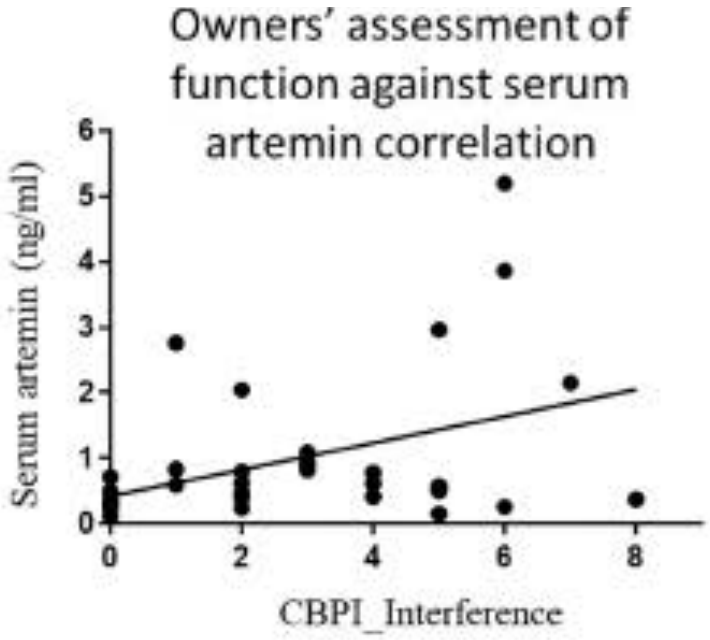
Artemin Concentrations in Synovial Fluid Correlate to Limb-use



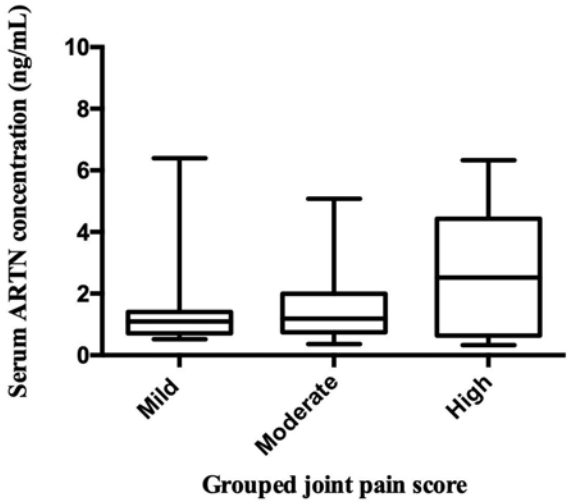
- Negative values of Symmetry Index (SI) correspond to decreased limb use.
- Increased synovial fluid concentrations of artemin correspond to less limb use (n=8; R^2=0.62; p=0.02).



Owner-assessed disability shows some relationship to serum ARTN concs (Minnema et al 2020; confirmed with larger 'n' in Gupta, submitted)

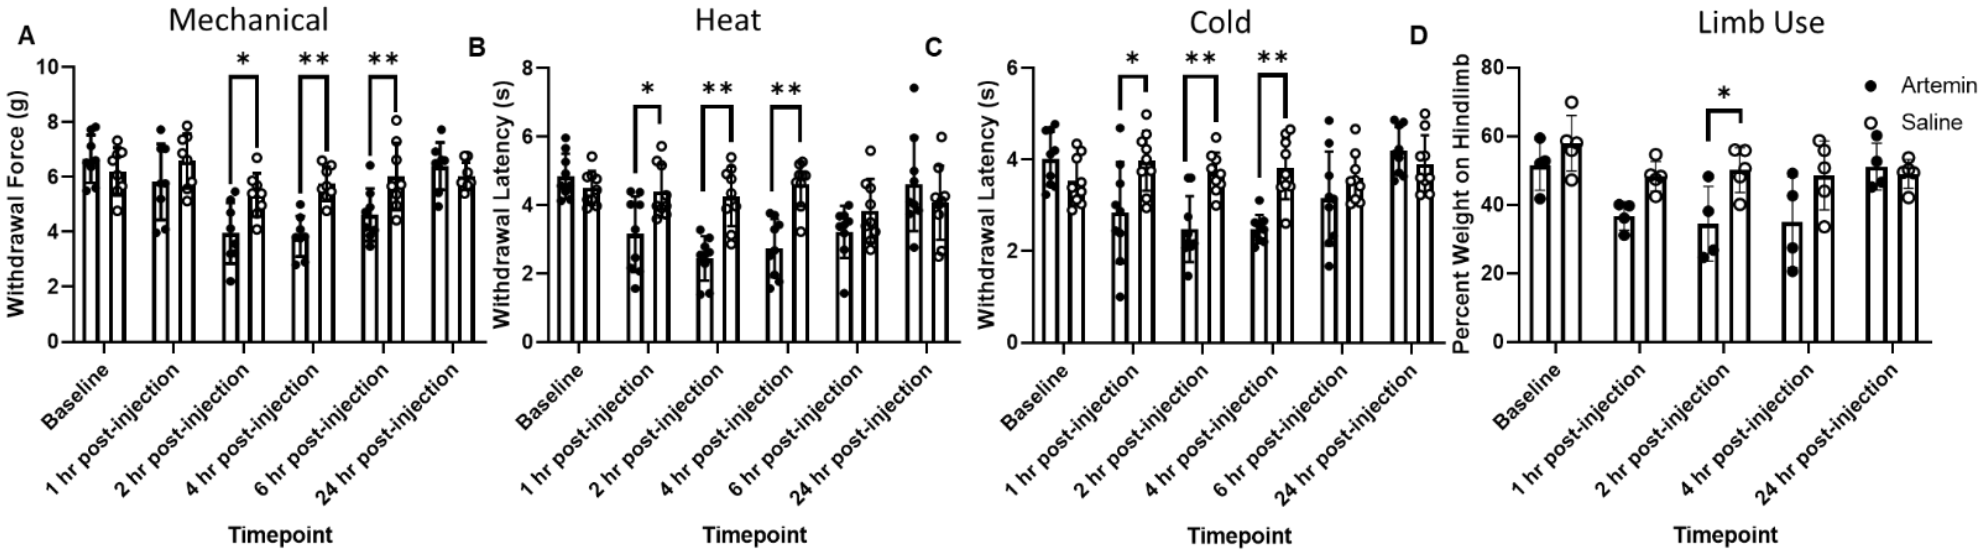


Total joint pain scores do positively correlate with serum ARTN (Gupta, submitted)

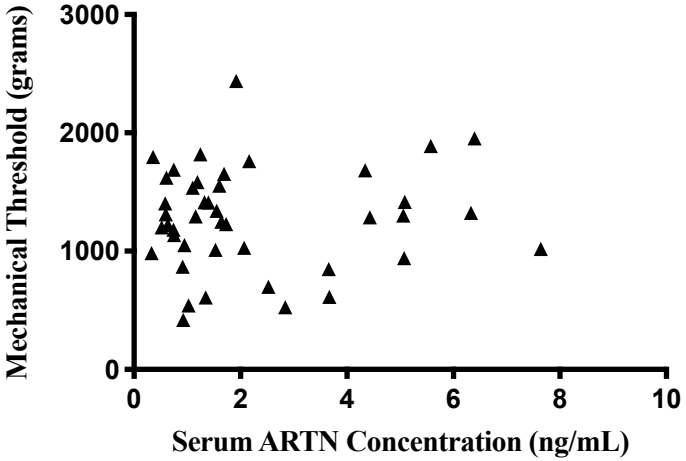


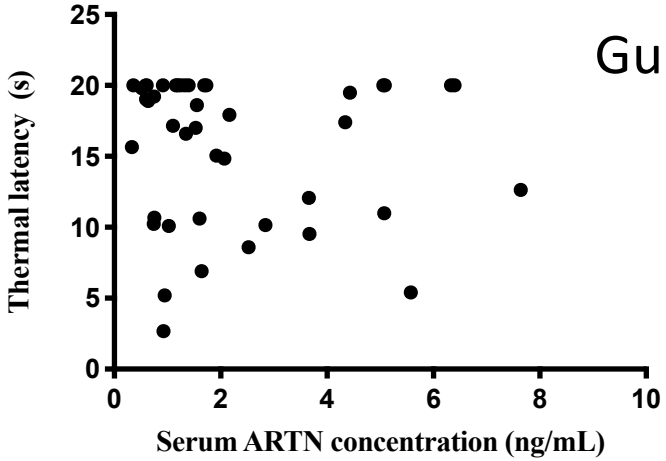
TRiP

Mouse: 200ng artemin (into paw) produces mechanical, heat and cold sensitivity, in association with decreased limb use



Within a cohort of dogs with OA-pain, serum ARTN does is not associated with remote (from OA joint) sensitivity as measured by QST (n=43)





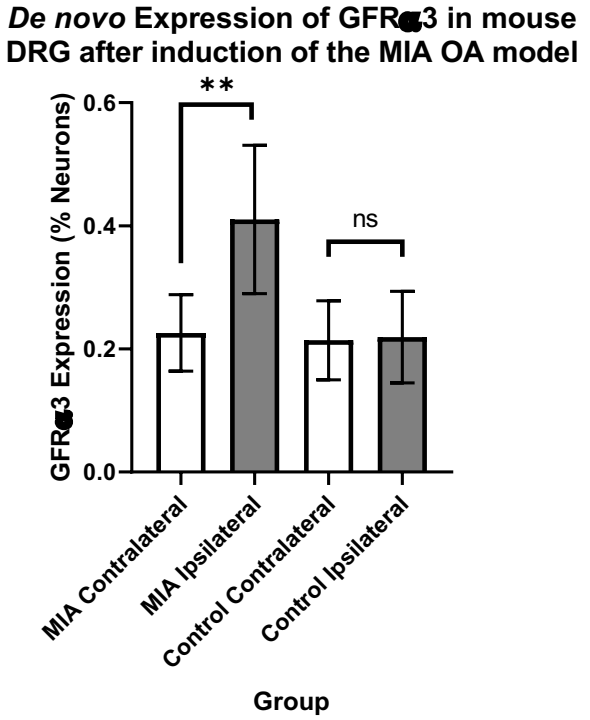
Gupta, submitted

TRiP

Early data in mouse model of OA

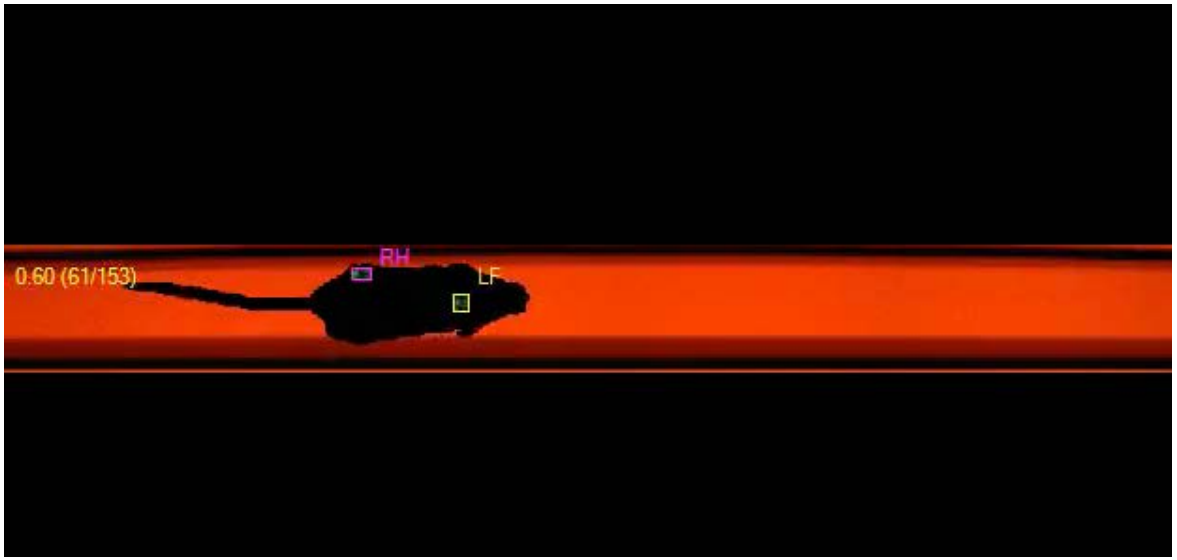
- ARTN (SC, paw) induces mechanical, heat and cold hypersensitivity
- Increase in GFRα3 in DRG (IHC) with MIA
- No increase in serum ARTN in 'single joint' MIA, versus controls; no increase in serum ARTN in bilateral DMM (samples courtesy of A-M Malfiat)
- IA injection of anti-GFRα3 Ab does not improve limb use (MIA model)
- IP injection of anti-ARTN mAb significantly decreases mechanical, heat and cold hypersensitivity in MIA model

N = 8-12 in all groups; replication ongoing



10 ug in 10 ul of a polyclonal anti-GFRα3 antibody (abcam; Cat. ab2028) or IgG isotype control (R&D; rabbit IgG) dissolved in PBS

PBS or 25 ug of anti-artemin monoclonal antibody (R&D, cat: MAB10851-500) dissolved in PBS



TRiP

Next steps:

- Detail the expression and co-expression of GFRα3 with TRP channels
- Understand the role of ARTN and GFRα3 in initiating (early) and maintaining (late) OA in different models
  - DMM; MIA
  - Anti-bodies; GFRα3 KO; GFRα3 mutants (non-functional)
- Understand parallel and alternative signaling (GFRα3 vs. GFRα1; RET vs. NCAM)
- Elucidate the downstream targets (TRP receptors)
- Verify findings using *ex vivo* and *in vivo* work in pet dogs

TRiP

Companion animal ‘models’ can contribute to translational pain research in two basic ways

1) Discovery / Face Validity of Target: Tissue from naturally occurring disease states may provide vital information about the neurobiology of pain in the natural disease state.

1) Verification bridge between rodent preclinical and human clinical studies, testing drugs for efficacy prior to human clinical studies
