Description of the problem
9 patients made nearly 2,700 ER visits in Texas

Wed Apr 1, 9:19 pm ET

AUSTIN, Texas – Just nine people accounted for nearly 2,700 of the emergency room visits in the Travis area during the past six years at a cost of $3 million to taxpayers and others, according to a report. The patients went to hospital emergency rooms 2,678 times from 2003 through 2008, said the report from the nonprofit Integrated Care Collaboration, a group of health care providers who care for low-income and uninsured patients.

“What we’re really trying to do is find out who’s using our emergency rooms … and find solutions,” said Ann Kitchen, executive director of the group, which presented the report last week to the Travis County Healthcare District board.

The average emergency room visit costs $1,000. Hospitals and taxpayers paid the bill through government programs such as Medicare and Medicaid, Kitchen said.

Eight of the nine patients have drug abuse problems, seven were diagnosed with mental health issues and three were homeless, according to the report. Seven are women whose average age is 40, and four are men whose average age is 50, the report said. The Austin American-Statesman reported Wednesday.

“It’s a pretty significant issue,” said Dr. Christopher Ziebell, chief of the emergency department at University Medical Center at Brackenridge, which has the busiest ERs in the area.

Solutions include referring some frequent users to mental health programs or primary care doctors for future care, Ziebell said.

“They have a variety of complaints,” he said. With mental illness, “a lot of anxiety manifests as chest pain.”

88.1% = 1 or 0 visits

(DHMH Report to Maryland General Assembly, 2007)
ED population characteristics: Children
Target Population: Children

- 50% of ED visits were rated as high appropriateness; one third for illness not serious
- 41% of parents/caregivers listed “reassurance” as reason for ED visit, 37% listed “emergency situation”
- Medicaid patients who could name a PCP were more likely to have appropriate ED visit (54% to 38%)
- Timeliness and access to primary care = less ED use
- Parents uneducated about asthma preventive care and care management available

(Stanley, Zimmerman, Hashikawa, & Clark, 2007); (Frederickson et al, 2004) (Moon, Laurens, Weimer, & Levy, 2005); (Brousseau et al., 2009)
Reasons for non-emergent PED utilization for an inner-city pediatric population

- Questionnaires and interviews: why using ED as primary care?
- N = 210, Univ. Hospital New Orleans (73% Medicaid; high AA)

</tbody>
</table>

(DHMH Report to Maryland General Assembly, 2007)
ED population characteristics: Frequent Utilizers
Target Population: Frequent ED users

Demographics

• Male, single/divorced, <=HS Ed, low income

Health status

• Recent hospitalization
• Psychological distress
• Asthma
• High use of other health resources, but poor referral follow-up

(Sun, Burstin, & Brennan, 2003); (Ruger, Richter, Spitznagel, & Lewis, 2004)
Target Population: Stratified frequent ED users

Visit ED 3-20 times /year
- More likely to be hospitalized than patients visiting once or twice

Visit ED > 20 times/year  (MD 2006 N=583/866,028)
- Less likely to be hospitalized
- Non-urgent conditions
- Lower severity scores than only one visit patients
- More likely to leave ED AMA that only one visit patients
- Lower average costs than only one visit patients

(Ruger, Richter, Spitznagel, & Lewis, 2004)
Prevalence of psychiatric diagnoses among frequent users of rural EDs

- 93% of frequent (avg. 12 visits/year) ED users had at least 1 psychiatric diagnosis
- MDD, GAD, Alc abuse, somatoform pain, BPD, dysthymia most common diagnoses
- Under-documentation of psychiatric disorders (9% recorded by treating physician)
- Medicaid > Commercial

(Mehl-Madrona, 2008)
Strategies: Target Frequent Users?

- Oregon Medicaid (2002): ED costs = 6.8% of total medical costs. 50% of all ED expenditures could be attributed to 3% of Medicaid enrollees. “…target selected enrollees rather than attempting overall ED use reduction.”

- MSW intensive case management pilot (N=53) x 1 yr
  - Sig. reduction in homelessness, drug & alcohol use
  - Sig. reduction in ED visits, increase in OP visits
  - ROI of $1.44

(Handel, McConnell, Wallace, & Gallia, 2008); (Okin et al.; 2000); (Larimer et al., 2009)
Strategies: Other Interventions to Reduce ED Utilization?

- Greater onsite medical care in low and moderate volume drug treatment clinics
- Mailing out books on non-urgent conditions = n.sig.
- Assigning non-acute patients in the ED to next day care = no AE

(Washington et al. 2002); (Laine, Lin, Hauck, & Turner, 2005); (Rector, Venus, & Laine, 1999)
Strategies: Managed Care to Reduce ED Utilization

• Care management and uninsured:
  – Annual call = n.sig.
  – PCP assigned + benefits = n. sig
• MC enrollment associated with 23% reduction in ED use among Medicaid special needs children (Michigan)
• Stepped up care for adults with ED anxiety diagnoses = lower ED
• MC reduces ED use for all Medicaid racial groups; does not reduce disparities (Florida)
• Multiple asthmatic children studies lower ED use

(Kwack et al., 2004); (Dombkowski, Stanley, & Clark, 2004); (Powers, 2000); (Kolbasovsky, Reich, Futterman, & Meyerkopf, 2007); (Cook, Emiliozzi, Waters, & El Hajj, 2008); (Kominski, Morisky, Afifi, & Kotlerman, 2008); (Pollack, Wheeler, Cowan, & Freed, 2007)
ED community (system) characteristics
Community (system level) Characteristics affecting ED use by Medicaid Enrollees

Predictors of **Higher** ED Utilization Rates in Oregon Primary Care Service Areas (PCSAs)

- **Lower** Primary Care Capacity
- **Shorter** Distance to Emergency Department

Predictors of **Higher** ED Utilization Rates in Oregon Medicaid children

- **Closer** to ED
- **Farther** from primary care

(Lowe et al., 2006, 2009); (Ludwick, Fu, Warden, & Lowe, 2009)
### Impact of Medicaid Cutbacks on ED Use: the Oregon Health Plan’s 2003 Experience

(Lowe et al., 2006); (Lowe & Fu, 2008); (McConnell, Wallace, Gallia, & Smith, 2008); (Rimsza, Butler, & Johnson, 2007); (Wallace, McConnell, Gallia, & Smith, 2008)
Strategies: Increase Access to Medical and PCP Services?

• Less ED utilization and lower pmpm costs resulted from:
  – Extending office hours at PCP offices
  – Increasing access locations
  – Care coordination
  – Lower ratio of active patients per clinician hour of practice time
  – Telephone triage systems

(Wang, Villar, Mulligan, & Hansen, 2005); (Lowe et al. 2005); (Piehl, Clemens, & Joines, 2000)
Cost and Utilization Analysis of a Pediatric Emergency Department Diversion Project

Large, private, primary care group offered:
  • extended office hours
  • multiple access locations
  • care coordination

Population: < 18 years of age; Medicaid or Medicaid eligible

Intervention Practice: N = 17,382
Comparison Practices: N = 26,066

Result: PMPM ED $1.36 less in Intervention practice.

(Wang et al., 2005)
ED community (system) characteristics: Baltimore City and Maryland
Report to the General Assembly: ED Visits for Medicaid Enrollees, October 2007

• In 2006, there were 498,089 ED visits for all Medicaid enrollees
• Enrollees age 40-64 make up 13.7% of total Medicaid population with 118,396 enrollees, but account for 23.8% of ED visits
• Enrollees with high comorbidity conditions accounted for 28% of all ED visits but only 6.2% of the population
• 47.3% of visits were for a form of ED care which could have been avoided or prevented

(DHMH, Report to the General Assembly, 2007)
“Ambulatory care sensitive (ACS) rates have been used as indicators of the availability and effectiveness of the primary care system.”

(Gresenz, Ruder & Lurie, 2009)
NYU EMERGENCY DEPARTMENT CLASSIFICATION ALGORITHM [V2.0]

Emergent
- ED care needed
  - Not preventable/avoidable
  - Preventable/avoidable

Non-Emergent
- Primary care treatable
- Mental health related
- Alcohol related
- Substance abuse related
- Injury
- Unclassified

(Source: NYU, Robert F. Wagner School of Public Service; http://wagner.nyu.edu/chpsr/index.html?p=25)
Classification of All ER Visits for the Medicaid Population, CY 2006

- Non-emergent, 20.7%
-Emergent, Primary Care Treatable, 19.8%
- Emergent, ER Care Needed, Preventable/Avoidable, 6.8%
- Emergent, ER Care Needed, Not Preventable/Avoidable, 7.5%
-Inpatient, 16.4%
-Injury, 16.7%
-Psych, 3.2%
-Drug, 0.2%
-Alcohol, 0.8%
-Unclassified, 8.0%

47.3% of ER visits fall under non-emergent, primary care treatable, or avoidable/preventable.

(DHMH Report to Maryland Legislature, 2007)
The Rand Report Recommendations

- Increase access to primary care (est. additional 130,000 to 159,000 primary care visits)
- Urgent care centers with walk-in capacity; evening and weekend capacity
- Better coordination of care

(Gresenz et al., 2009)
Review conclusions

• Geographic factors, chronic health conditions, and primary care access are all predictors of ED utilization patterns for Medicaid enrollees.

• Potentially successful strategies include increased access to primary care and managed care interventions.

• Managed care associated with decreased ED use; disenrollment from Medicaid associated with cost-shifting.
Going Forward…

1. Interventions
   a) What characteristics (patient, community, plan) are modifiable?
   b) New interventions that have not been tried?
   c) Which interventions are the best use of resources?

2. Case Finding and Matching
   a) Whom do we target for interventions?
   b) What types of interventions are appropriate for each group targeted?
Going Forward…Measurement

1. ED population
   a) Target population for intervention
   b) Metric’s denominator should reflect the characteristics of the (sub)population, e.g., age range, chronic condition, frequent ED user status, residence locality.
   c) Comparison group to avoid simple pre-post validity challenges

2. Intervention
   a) Describe the theorized causality and context
   b) Measure the intervention, e.g., intensity, frequency, duration
An action is causal only if its outcome is triggered by a mechanism acting in context.

(Pawson & Tilley, 1997)
Review

1. Description of problem
2. ED population characteristics
3. ED use in Maryland and Baltimore
4. Strategies to reduce ED utilization
